Instructions: Name your file hw1.py and submit on CCLE. Add comments to each function.

• Problem 1:

Write a function largerIndex(c) that takes as input a list c of numbers, and returns a new list k, such that k[i] = 1 if c[i] > i, k[i] = 0 if c[i] = i, k[i] = -1 if c[i] < i.

Test cases:

```
11 = [1,2,0,4,2,1,40,-5]

12 = [0,3,2,1,32,3,4,0]

largerIndex(11) should return [1, 1, -1, 1, -1, -1, 1, -1].

largerIndex(12) should return [0, 1, 0, -1, 1, -1, -1, -1].
```

• Problem 2:

Write a function squareUpTo(n) that takes as input a positive integer n, and returns a list of all the square numbers up to (and possibly including) n.

Test cases:

```
squareUpTo(10) should return [0, 1, 4, 9].
squareUpTo(100) should return [0, 1, 4, 9, 16, 25, 36, 49, 64, 81, 100].
```

• Problem 3:

Write a function fliplin3() that uses only "fair coins" to generate a "biased coin" with success probability 1/3. That is, this function returns False with probability 2/3 and returns True with probability 1/3.

• Problem 4:

Write a function duplicates(c) that takes as input a list c of integers. Some elements appear twice and others appear once. The function outputs all the elements as a list that appear twice in the list c. The elements in the output should preserve the original order.

Test cases:

```
13 = [1,2,5,3,6,2,4,5]
14 = [1,3,5,5,1,4,3]
duplicates(13) should return [2,5].
duplicates(14) should return [1,3,5].
```
